

Trust & Data Governance

Public-sector-credible copy, ready for implementation. Legal-safe by default.

Section headline

Built for public-sector trust — privacy-aware, auditable, and under your control.

Subheadline

Trafiqo is a decision-support platform, not an autonomous system. Cities and transport authorities stay in control; every recommendation is documented, testable, and human-reviewed.

Trust statements

- Trafiqo works only with aggregated, anonymised mobility data approved by city partners.
- We model synthetic agents — simulated populations — never named individuals.
- Data ownership stays with the city or its authorised operator. Trafiqo acts as a contracted technology provider.
- Trafiqo is designed as decision-support with human oversight, aligned with the EU AI Act's risk-based approach.
- Model outputs are documented, testable, and auditable — no black-box decisions.
- We support DPIA and contractual GDPR compliance for public-sector deployments where required.

FAQ

What data does Trafiqo use?

Aggregated mobility and traffic inputs — traffic volumes, road-network demand, pricing signals, events, and contextual factors. We use data approved and provided through city partners, not raw personal records.

Does Trafiqo process personal data?

Trafiqo is designed to operate on aggregated and anonymised or properly pseudonymised data. Our behavioural models run on synthetic agents representing population-level patterns, not identifiable individuals. Where any processing could fall under GDPR, we support the required safeguards, including DPIA.

Who owns the data?

The city or its authorised operator. Trafiqo operates as a technology provider under contractual terms and does not claim ownership of partner data.

How is the model validated?

Through historical backtesting on real city data, out-of-sample testing, and pilot calibration with transport authorities. Outputs include confidence indicators so cities can judge reliability, rather than treating predictions as certainties.

Is Trafiqo high-risk AI under the EU AI Act?

Trafiqo is built as a decision-support tool with human oversight, not as an autonomous safety or infrastructure-control system. It is designed to align with the EU AI Act's risk-based approach; final classification depends on the specific deployment, which we assess together with each city.

Why does pilot deployment matter?

A pilot calibrates the model against real local conditions, proves measurable impact, and establishes a procurement-ready, KPI-based path to scale — reducing risk before any city-wide commitment.

Does Trafiqo make decisions automatically?

No. Trafiqo produces recommendations and scenario analysis. City experts review and decide. Humans stay in the loop by design.

Two versions (per the regulatory brief)

LEGAL-SAFE VERSION — use on the live page

All copy above uses conditional language (*designed to, aligned with, supports, depends on deployment*). This is the public-facing version. In B2G it protects against overclaiming.

MORE COMMERCIAL VERSION — for the hero area only

“Trafiqo gives cities a privacy-first way to see how people will respond — before congestion happens. Aggregated data, synthetic populations, full human oversight.”

Use this near the hero — not in the legal section, where the legal-safe version stays.
